## Introduction

---

SyriaTel has tasked me to provide prediction analysis on whether their customers will churn soon. To churn in its broadest sense according to wikipedia is, "A measure of the number of individuals or items moving out of a collective group over a specific period."

## Stakeholder:

- SyriaTel Communications

## Data:

The title of this dataset is called "Churn in Telecom's dataset" from [kaggle.com](https://www.kaggle.com/datasets/becksddf/churn-in-telecoms-dataset) (<https://www.kaggle.com/datasets/becksddf/churn-in-telecoms-dataset>)

- Number of records: 3333
- Number of columns: 20
- Target variable: **churn**

## Models:

- Baseline model: Logistic regression
- Model 2: Decision tree
- Model 3: Random forest

## Evaluation Metric:

I have elected to use **Recall** as my evaluation metric for this particular project. The recall score is true positive divided by the true positive plus the false negative. It is the measure of actual observations which are predicted correctly. I chose this metric because we want to capture as many positives as possible, and is the best metric to use when we have imbalanced data.

# Import Libraries

Firstly, we must import the necessary library packages for this project.

```
In [1]: 1 import pandas as pd
2 import numpy as np
3 import matplotlib.pyplot as plt
4 %matplotlib inline
5 import seaborn as sns
6 import warnings
7 warnings.filterwarnings('ignore')
8
9 from sklearn.pipeline import Pipeline
10 from sklearn.model_selection import train_test_split, GridSearchCV
11 from sklearn.preprocessing import OneHotEncoder
12 from sklearn.linear_model import LogisticRegression
13 from sklearn.metrics import confusion_matrix
14 from sklearn.metrics import plot_confusion_matrix, classification_report
15 from imblearn.over_sampling import RandomOverSampler
16
17
18 from sklearn.metrics import precision_score, recall_score, accuracy_score
19
20
21 from sklearn.tree import DecisionTreeClassifier
22 from sklearn import tree
23 from sklearn.ensemble import RandomForestClassifier, BaggingClassifier
```

## Column Descriptions

- **state** , string. 2-letter code of the US state of customer residence
- **account\_length** , numerical. Number of months the customer has been with the current telco provider
- **area\_code** , string="area\_code\_AAA" where AAA = 3 digit area code.
- **international\_plan** , (yes/no). The customer has international plan.
- **voice\_mail\_plan** , (yes/no). The customer has voice mail plan.
- **number\_vmail\_messages** , numerical. Number of voice-mail messages.
- **total\_day\_minutes** , numerical. Total minutes of day calls.
- **total\_day\_calls** , numerical. Total minutes of day calls.
- **total\_day\_charge** , numerical. Total charge of day calls.
- **total\_eve\_minutes** , numerical. Total minutes of evening calls.
- **total\_eve\_calls** , numerical. Total number of evening calls.
- **total\_eve\_charge** , numerical. Total charge of evening calls.
- **total\_night\_minutes** , numerical. Total minutes of night calls.
- **total\_night\_calls** , numerical. Total number of night calls.
- **total\_night\_charge** , numerical. Total charge of night calls.
- **total\_intl\_minutes** , numerical. Total minutes of international calls.
- **total\_intl\_calls** , numerical. Total number of international calls.

- **total\_intl\_charge** , numerical. Total charge of international calls
- **number\_customer\_service\_calls** , numerical. Number of calls to customer service
- **churn** , (yes/no). Customer churn - target variable.

## Loading The Data

The next step is to extract the data and put in a pandas dataframe, and to print the first 5 rows to see if the data was imported correctly.

```
In [2]: 1 data = pd.read_csv('churn_telecom.csv')
        2 data.head()
```

5 rows × 21 columns

## Exploring and Cleaning the data

Below I am exploring the data, and checking what the data types of each columns with the `.info()` function, the descriptive statistics of the data with the `.describe()` function, and finally I will check for any missing data using the `.isna()` function.

```
In [3]: 1 # inspect how many records there are, and the data types for each column
        2 data.info()
```

```
<class 'pandas.core.frame.DataFrame'>
RangeIndex: 3333 entries, 0 to 3332
Data columns (total 21 columns):
 #   Column                                Non-Null Count  Dtype
---  -
 0   state                                3333 non-null   object
 1   account length                       3333 non-null   int64
 2   area code                           3333 non-null   int64
 3   phone number                         3333 non-null   object
 4   international plan                   3333 non-null   object
 5   voice mail plan                      3333 non-null   object
 6   number vmail messages                3333 non-null   int64
 7   total day minutes                    3333 non-null   float64
 8   total day calls                      3333 non-null   int64
 9   total day charge                     3333 non-null   float64
10   total eve minutes                    3333 non-null   float64
11   total eve calls                      3333 non-null   int64
12   total eve charge                     3333 non-null   float64
13   total night minutes                  3333 non-null   float64
14   total night calls                    3333 non-null   int64
15   total night charge                   3333 non-null   float64
16   total intl minutes                   3333 non-null   float64
17   total intl calls                     3333 non-null   int64
18   total intl charge                    3333 non-null   float64
19   customer service calls               3333 non-null   int64
20   churn                               3333 non-null   bool
dtypes: bool(1), float64(8), int64(8), object(4)
memory usage: 524.2+ KB
```

At first glance, it appears for the most part the columns that are numerical are the correct data type. However, there are a couple columns that are the object data type that need to be changed to something numerical. The "international plan" and the "voice mail plan" have entries in the form of "yes" or "no" need to be changed to 1 for "yes" and 0 for "no". Likewise the "churn" column needs to be changed into a different data type and will have entries changed to numerical entries such as 1 for "True" and 0 for "False".

```
In [4]: 1 # Descriptive statistics on each column of the dataset
        2 data.describe()
```

```

Great! there is no missing values to take care of. However, I will next add an underscore "\_" as that is conventional in the python language.

```
In [6]: 1 data.columns = data.columns.map(lambda col: col.replace(' ', '_'))
        2 print(data.columns)

Index(['state', 'account_length', 'area_code', 'phone_number',
       'international_plan', 'voice_mail_plan', 'number_vmail_messages',
       'total_day_minutes', 'total_day_calls', 'total_day_charge',
       'total_eve_minutes', 'total_eve_calls', 'total_eve_charge',
       'total_night_minutes', 'total_night_calls', 'total_night_charge',
       'total_intl_minutes', 'total_intl_calls', 'total_intl_charge',
       'customer_service_calls', 'churn'],
      dtype='object')
```

Next I shall check the unique values of the dataset to see if there are any place holders for missing values.

```

In [7]: 1 # inspect unique values of columns to identify potention errors or null
        2 for col in data.columns:
        3     print(f"{col} vals: {data[col].unique()} \n")

churn vals: [False  True]
```

Some things I noticed:

- **States** look good.
- There are only 3 area codes
- "**international\_plan**", "**voice\_mail\_plan**" have yes/no values and will need to be changed to a 1 and 0.
- Phone number can probably be dropped from the dataset because, it shouldn't be a reason why customer is choosing to churn.
- The target variable "**churn**" has a boolean value, and needs to be changed to a 1 and 0.

**Map columns: international plan, voice mail plan, and churn**

```
In [8]: 1 data['international_plan'] = data['international_plan'].map({'no': 0, '
2 data['voice_mail_plan'] = data['voice_mail_plan'].map({'no': 0, 'yes':
3 data['churn'] = data['churn'].map({False: 0, True: 1})
4 data.info()
```

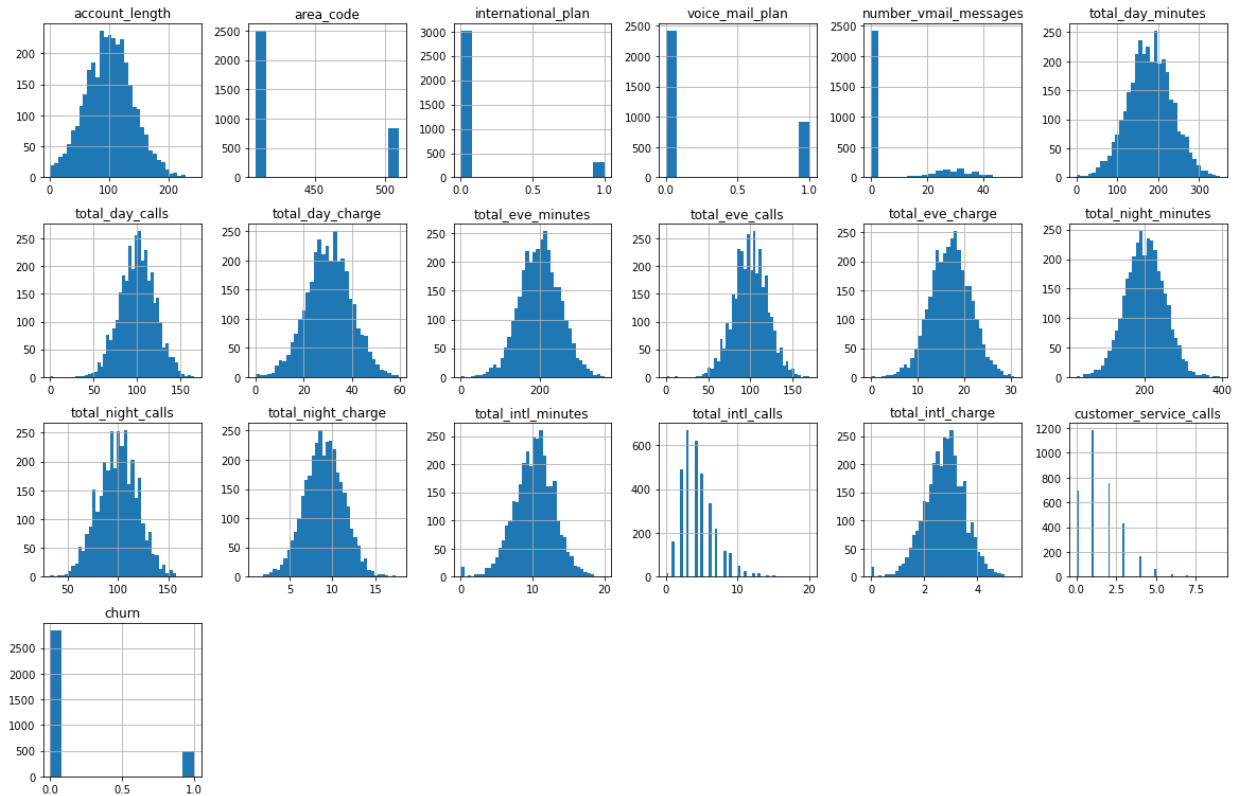

```

## Drop phone number column

```
In [9]: 1 # Drop the phone_number column from the dataset
2 data.drop("phone_number", axis=1, inplace=True)
```

## Check the distribution of the data

```
In [10]: 1 data.hist(bins = 'auto', layout = (6,6), figsize = (20,20))  
2 plt.show()
```

## Exploration and Visualization of Churn Data

Next I am curious and want visualize what the number of customers have churned and their percentages.

```
In [11]: 1 print("Churn Counts")
          2 print(data["churn"].value_counts())
          3 print()
          4 print("Percentages")
          5 print(data["churn"].value_counts(normalize=True))
```

Churn Counts

0 2850

1 483

Name: churn, dtype: int64

Percentages

0 0.855086

1 0.144914

Name: churn, dtype: float64

Of the 3333 customers from the data set **14.5%** have terminated their service with SyriaTel. I am curious if a certain area code has a greater number of churns over the other.

## Visualization of percentage of customers that have churned

```
In [12]: 1 # Percentages of current customers vs customer churn
2 churn_per = data["churn"].value_counts(normalize=True)
3
4 # Plot of percentages
5 fig, ax = plt.subplots(figsize = (10, 8))
6 sns.barplot(x = [0, 1], y = data["churn"], palette="rocket", data = churn_per)
7 plt.title('Percentage of Customer Churn', fontsize = 25)
8 ax.tick_params(axis='both', labelsize=15)
9 plt.xlabel('Churn', fontsize=20)
10 plt.ylabel('Churn Rate', fontsize=20)
11 ax.set_xticklabels(['Churned Customers', 'Active Customers'])
12 plt.tight_layout()
```

**Visualization of number of customers churned per area code**

```
In [13]: 1 # percentage of churn by area code
2 print(data.groupby(["area_code"])[ 'churn' ].mean())
3
4 fig, ax = plt.subplots(figsize = (15, 8))
5 data.groupby(['area_code', 'churn']).size().unstack().plot(kind='bar',
6 plt.title('SyriaTel Customers per Area Code Split by Churn', fontsize =
7 ax.tick_params(axis = 'both', labelsz = 15)
8 plt.xlabel('Area Code', fontsize = 20)
9 plt.ylabel('# of Customers', fontsize = 20)
10 plt.tight_layout()
11
12 ##rotate x-axis to a 45 degree angle
13 for label in ax.xaxis.get_ticklabels():
14     label.set_rotation(45)
```

```
area_code
408    0.145585
415    0.142598
510    0.148810
Name: churn, dtype: float64
```

After further investigation, it is clear that the 415 area code has more customers than the 408 or 510 area codes. However, all three area codes have around the same **churn rate**. Since there is no clear pattern, I believe it is safe to delete the area code column from the dataset as well.

- **churn rate** – is the rate at which customers or clients are leaving a company within a specific period of time.

## Drop area code column

```
In [14]: 1 # Drop the area_code column from the dataset
        2 data.drop('area_code', axis=1, inplace=True)
```

```
In [15]: 1 # Check to see if phone_number and area_code columns have been removed
        2 data.columns
```

```
Out[15]: Index(['state', 'account_length', 'international_plan', 'voice_mail_plan',
               'number_vmail_messages', 'total_day_minutes', 'total_day_calls',
               'total_day_charge', 'total_eve_minutes', 'total_eve_calls',
               'total_eve_charge', 'total_night_minutes', 'total_night_calls',
               'total_night_charge', 'total_intl_minutes', 'total_intl_calls',
               'total_intl_charge', 'customer_service_calls', 'churn'],
              dtype='object')
```

## EDA continued: Correlation between churn and other features

| 1                  | 0.424149 |

It appears 42% customers with an international plan with SyriaTel, end up churning. On a business stand point, this may be a worthwhile topic to further investigate.

```
In [18]: 1 # International plan bar plot
2 fig, ax = plt.subplots(figsize=(13,7))
3 sns.barplot(data=data, x=data['international_plan'], y='churn', palette
4 plt.title('Percentage Churn of International Plan Holders', fontsize=25
5 plt.xlabel('International Plan Yes/No', fontsize=20)
6 plt.ylabel('Churn Rate', fontsize=20)
7 ax.set_xticklabels(['No International Plan', 'Has International Plan'],
8 plt.tight_layout;
```

For customer service calls, you would imagine the more calls a customer must make to customer service, the likely they are to be unhappy with their phone service. But how many calls on average does it take to increase the likely hood for a customer to churn. Let's take a look.

```
In [19]: 1 cust_serv_calls = pd.DataFrame(data.groupby(['customer_service_calls']))
          2 cust_serv_calls
```

Out[19]:

| churn                  |          |
|------------------------|----------|
| customer_service_calls |          |
| 0                      | 0.131994 |
| 1                      | 0.103302 |
| 2                      | 0.114625 |
| 3                      | 0.102564 |
| 4                      | 0.457831 |
| 5                      | 0.606061 |
| 6                      | 0.636364 |
| 7                      | 0.555556 |
| 8                      | 0.500000 |
| 9                      | 1.000000 |

```
In [20]: 1 # Bar plot for customer service calls
          2 fig, ax = plt.subplots(figsize=(13,7))
          3 sns.barplot(data=data, x=data['customer_service_calls'], y='churn',pale
          4 plt.title('Churn Rate in Relation to Customer Service Calls', fontsize=
          5 plt.ylabel('Churn Rate', fontsize=20)
          6 plt.xlabel('Number of Calls', fontsize=20)
          7 plt.tight_layout();
```

From the graph above, it is evident that when a customer has to call customer service four times, the likely hood of a customer to churn significantly increases. When a customer needs to call a

maximum 9 times, the churn rate reaches 100%. Looking at this in a business perspective, new strategies must be discussed to handle unhappy customers when they are calling customer service by the fourth time.

## Total Day Charge

```
In [21]: 1 tdc = data.groupby(data['churn'])\
2         ['total_day_charge'].mean().sort_values(ascending=False).rese
3 tdc.head()
```

Out[21]:

|   | churn | total_day_charge |
|---|-------|------------------|
| 0 | 1     | 35.175921        |
| 1 | 0     | 29.780421        |

```
In [22]: 1 # total_day_charge plan bar plot
2 fig, ax = plt.subplots(figsize=(13,7))
3 sns.barplot(data=tdc, x='churn', y='total_day_charge', palette="rocket")
4 plt.title('Average Total Day Charge of Customers', fontsize=25)
5 plt.xlabel('Churn', fontsize=20)
6 plt.ylabel('Average Total day Charge', fontsize=20)
7 ax.set_xticklabels(['No', 'Yes'], fontsize=15)
8 plt.tight_layout;
```

Graph above shows the average day charge a SyriaTel customer has, and when they are on average churning. Per the data, when a customer is around the 35.18 mark for their average day charge, they are more likely to churn. 29.78 and lower is the price the company should strive to be around in order to keep their customers from churning.

## Create dummy variables for state column

```
In [23]: 1 state_dum = pd.get_dummies(data['state'], drop_first=True)
```

```
In [24]: 1 data_final = data.drop('state', axis=1)
```

```
In [25]: 1 data_final = pd.concat([data_final, state_dum], axis=1)
2 data_final.head()
```

Out[25]:

|   | account_length | international_plan | voice_mail_plan | number_vmail_messages | total_day_minutes | t |
|---|----------------|--------------------|-----------------|-----------------------|-------------------|---|
| 0 | 128            | 0                  | 1               | 25                    | 265.1             |   |

In [49]: 1 print("Test Accuracy for Random Forest: {:.4}%".format(accuracy_score(y
```

```
Test Accuracy for Random Forest: 88.01%
```

### Results:

- Training data recall score: 30%
- Test data recall score: 23%

## Tuning the model with GridSearchCV

```
In [50]: 1 param_grid = {'criterion':['gini','entropy'],
2                   'max_depth':[3,6,9,12],
3                   'min_samples_leaf': [5,10,12],
4                   'n_estimators': [10, 12, 15, 20]
5                   }
```

### Fit the gridsearch

```
In [51]: 1 rfc = RandomForestClassifier(n_estimators=10, max_depth=5, random_state=42)
2   grid_rfc = GridSearchCV(rfc, param_grid, cv=5, scoring='accuracy')
3   grid_rfc.fit(X_train, y_train)
```

```
Out[51]: GridSearchCV(cv=5,
                    estimator=RandomForestClassifier(max_depth=5, n_estimators=10,
                    random_state=42),
                    param_grid={'criterion': ['gini', 'entropy'],
                    'max_depth': [3, 6, 9, 12],
                    'min_samples_leaf': [5, 10, 12],
                    'n_estimators': [10, 12, 15, 20]},
                    scoring='accuracy')
```

### Display the gridsearch results

```
In [52]: 1 # Print the best parameters
2   grid_rfc.best_params_
```

```
Out[52]: {'criterion': 'gini',
          'max_depth': 12,
          'min_samples_leaf': 5,
          'n_estimators': 12}
```

### Get predictions from gridsearch

```
In [53]: 1 # get predictions from the gridsearch
2   y_pred_grid = grid_rfc.predict(X_test)
3   y_pred_train_grid = grid_rfc.predict(X_train)
```

### Print confusion matrix and classification report for training data

```
In [54]: 1 #print confusion matrix and classification report
2 display(confusion_matrix(y_train, y_pred_train_grid))
3 print(classification_report(y_train, y_pred_train_grid))
```

```
array([[2140,    1],
       [ 105,   253]])

| macro avg    | 0.93      | 0.77   | 0.82     | 834     |
| weighted avg | 0.93      | 0.93   | 0.92     | 834     |

```
In [57]: 1 print("Test Accuracy for Random Forest Classifier: {:.4}%".format(accur
Test Accuracy for Random Forest Classifier: 92.69%
```

### Results:

- Training data recall score: 71%
- Test data recall score: 54%

## Feature Importance

Next we will examine how important each feature ended up being in our final model. In machine learning, feature selection is an important step. More features equals more complex models that take longer to train and are harder to interpret.

```
In [58]: 1 # Feature importance
          2 rf.feature_importances_
```

```
Out[58]: array([1.22494433e-02, 1.62707771e-01, 4.76229153e-02, 2.38905778e-02,
1.46961828e-01, 1.09306397e-02, 1.61786301e-01, 4.02865581e-02,
2.94028749e-02, 3.18338451e-02, 1.00894253e-02, 1.22712100e-02,
2.53034318e-02, 1.49793444e-02, 2.70418095e-02, 3.13637003e-02,
1.59027372e-01, 1.81158198e-03, 1.61274014e-03, 0.00000000e+00,
2.79599790e-03, 1.89470501e-03, 0.00000000e+00, 0.00000000e+00,
5.84599959e-04, 1.72440166e-03, 0.00000000e+00, 0.00000000e+00,
2.72819229e-04, 9.15745437e-04, 0.00000000e+00, 4.87626773e-04,
5.26425267e-03, 3.84937889e-03, 0.00000000e+00, 0.00000000e+00,
2.25138758e-03, 5.96763790e-03, 0.00000000e+00, 7.69026920e-04,
0.00000000e+00, 0.00000000e+00, 4.58178301e-03, 0.00000000e+00,
0.00000000e+00, 0.00000000e+00, 0.00000000e+00, 3.99977346e-03,
7.21375938e-04, 1.16223313e-03, 1.96181241e-03, 2.05621859e-04,
3.03082977e-03, 0.00000000e+00, 1.97705363e-03, 1.49307190e-03,
0.00000000e+00, 0.00000000e+00, 1.36076802e-04, 0.00000000e+00,
0.00000000e+00, 0.00000000e+00, 1.66817014e-03, 0.00000000e+00,
0.00000000e+00, 1.11004588e-03, 1.20263870e-06])
```

This array full of numbers isn't very helpful. Let's plot the data to see if the important features become more clear.

```
In [59]: 1 def plot_features_importances(model):
2         n_features = X_test.shape[1]
3         plt.figure(figsize=(15,20))
4         plt.barh(range(n_features), model.feature_importances_, align='center')
5         plt.yticks(np.arange(n_features), X_test.columns.values, fontsize = 25)
6         plt.xlabel('Feature Importance', fontsize = 25)
7         plt.ylabel('Feature', fontsize = 25)
8         plt.title('Final Model Feature Importance', fontsize = 25)
9         plt.tight_layout()
10
11 plot_features_importances(rf)
```

we can see from this feature importance graph that there are three features that the model is weighing more heavily, with little to no weight given to the states.

- **total\_day\_charge**
- **customer\_service\_calls**
- **international\_plan**

# Conclusion

## Logistic Regression:

- Recall Score (Training): 22%
- Recall Score (Test): 15%

## Decision Tree:

- Recall Score (Training): 72%
- Recall Score (Test): 66%

## Random Forest:

- Recall Score (Training): 30%
- Recall Score (Test): 23%

## Random Forest with GridSearchCV:

- Recall Score (Training): 71%
- Recall Score (Test): 54%

From our findings, I can conclude that the decision tree model was the best testing model having the highest recall score on it's training data as well as it's test data.

# Recommendations:

- 42% percent of the customers that have churned had international plans. Further discussion and investigations should be taken place to formulate a plan to retain these customers.
- Customers that have called customer service at least 4 times have a significantly increased chance of churning. Managers must come up with new training techniques to help customer service representatives assist these disgruntled customers.
- Investigate ways to retain customers that have an average total day charge of 35 dollars. Possibly creating more incentives and added perks to their phone plans could sway these customers from terminating their contracts.
